■ Our Reputation: the Materials-Specialist Steinbach Industrial Components

Steinbach Industrial Components is a division of Steinbach AG, a highly regarded and successful mid-size industrial supplier with 30 years of experience. One of the many reasons for the dynamic growth of this division: our clear focus on a comprehensive array of technical skills and superior products ranging from foam, elastomer, textile glass fibers, and heavy foils.

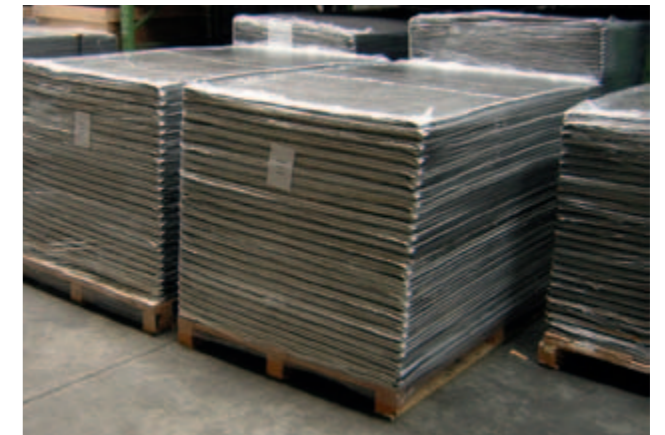

Quality from One Source

Our customers in machinery, equipment, and vehicle manufacture equate the name Steinbach Industrial Components with not only a detailed know-how and excellent product quality, but also with superior customer service. Purchasing, planning, cut-to-size, and delivery: you get the entire service package from one source. This saves time and increases efficiency.

Unique: Our Material Know-How

Through long term partnerships with leading material manufacturers, collaboration with technical universities, and continual research into the supply markets, we possess an exceptional portfolio of materials. Then in close cooperation with our customers, we develop innovative laminated materials for a wide variety of applications. Through it all, we pay close attention to the needs of ecology and economy. For example, we exclusively use harmless continuous filaments for our textile glass fiber products.

■ Our Standard: Solution Oriented Thinking, Customer Oriented Practices

The market is constantly changing. The requirements from our customers become more demanding. Because of technical progress, innovative and lower-cost solutions are needed – in particular, intelligent and precise manufacturing methods as well as forward-thinking materials.

Partnership is the Key to Success

Our customers in special vehicle or rail car manufacturing, as well as in machinery manufacturing expect not only a high level of quality, but also of customization. That means solutions that are precisely tailored to their needs. We develop these custom solutions with the same level of partnership that we commit to our increasingly popular comprehensive system solutions. Resourceful engineers together with competent and motivated associates are our capital. Their depth of experience

with the wide selection of materials and production technologies serve to create the optimal approach for each solution.

Highly Competitive Technology in the Background

Efficiency is our strength: customers tell us which dimensions, shapes, quantities, and packaging their components require, and we offer the appropriate tooling as well as the necessary pressing technique, assembly, and packaging technology for their needs. In our 4000 m² production facility, the Steinbach team can thermo-laminate, glue, stamp, water-jet, manually cut, edge-seal, assemble, sew, label, package and commission for shipping – regardless of whether the order is large or small. Our comprehensive semifinished products inventory ensures short delivery times and high flexibility.
